

Alibaba Cloud Toolkit

start.sh脚本

```
ps -fe | grep redis-server | grep -v grep
if [ $? -ne 0 ]
then
    echo "start redis..."
    /opt/tools/oaop_linux/redis/redis-server
    /opt/tools/oaop_linux/redis/redis.conf
    echo "start success..."
fi
log_file="logs/$(date +%Y%m%d%H%M%S*)_output.log"
if test -e $log_file;then
    ls -l $log_file
else
    touch $log_file
    chmod -R 777 $log_file
fi
nohup java -jar pt_fzyk.jar > $log_file 2>&1 &
tail -f $log_file
```

backup.sh脚本

```
pid=`ps aux | grep pt_fzyk.jar | grep -v grep | awk '{print $2}'`
echo $pid
time=$(date +%Y%m%d%H%M%S)
echo $time
mv /home/zhfzadmin/fzyk/pt_fzyk.jar /home/zhfzadmin/fzyk/pt_fzyk$time.jar
if [ $(ls -l | grep "pt_fzyk*" | wc -l) -gt 3 ]
then
    echo "file > 3"
    rm -r $(ls -rt|grep 'pt_fzyk*' | head -n2)
fi
if [ -n "$pid" ]
then
```

```
{  
    echo =====shutdown=====  
    echo $pid  
    kill -15 $pid  
    echo =====shutdownSuccess=====  
}  
fi  
exit
```

(这段可要可不要，因为我在start.sh中最后调用了一下这个命令)

tail -f /home/zhfzadmin/fzyk/logs/\$(date "+%Y%m%d%H%M%S")_output.log
